

# Data Mining for Business Analytics

## **MSBA 511**

Naïve Bayes Classifier

# Naïve Bayes Classification

The Naïve Bayes algorithm is a powerful probabilistic classifier based on Bayes' Theorem. Considered "**naïve**" since it assumes all features independent of each other, given the class label.

**Simple Idea:** Classify a record like records with the same values as the predictors

## Some key points:

- Another **data driven**, not model driven algorithm.
- **Non-parametric** so it makes no assumptions about the data distribution.
- Requires **categorical** variables.
  - Numerical variables must be binned and converted to categorical.
- Works well with text data commonly used in spam detection, sentiment analysis, and document classification.

# Exact Bayes Classifier

Relies on finding other records that share same predictor values as record-to-be-classified.

Want to find “probability of belonging to class  $C$ , given specified values of predictors.”

Even with large data sets, may be hard to find other records that **exactly match** your record, in terms of predictor values.

# Solution – Naïve Bayes

- Assume independence of predictor variables (within each class).
- Use multiplication rule
- Find same probability that record belongs to class C, given predictor values, without limiting calculation to records that share all those same values.

# Naïve Bayes Calculations

1. Take a record and note its predictor values.
2. Find the probabilities those predictor values occur across all records in  $C1$ .
3. Multiply them together, then by proportion of records belonging to  $C1$ .
4. Same for  $C2$ ,  $C3$ , etc.
5. Prob. of belonging to  $C1$  is value from step (3) divide by sum of all such values  $C1 \dots Cn$ .
6. Establish & adjust a “cutoff” prob. for class of interest.

# Example: Financial Fraud

**Target variable:** Audit finds fraud, no fraud

**Predictors:**

Prior Legal Trouble  
(Yes/No)

Company Size  
(Small/Large)

| Company | Prior Legal Trouble | Company Size | Audit Outcome |
|---------|---------------------|--------------|---------------|
| 1       | Yes                 | Small        | Truthful      |
| 2       | No                  | Small        | Truthful      |
| 3       | No                  | Large        | Truthful      |
| 4       | No                  | Large        | Truthful      |
| 5       | No                  | Small        | Truthful      |
| 6       | No                  | Small        | Truthful      |
| 7       | Yes                 | Small        | Fraud         |
| 8       | Yes                 | Large        | Fraud         |
| 9       | No                  | Large        | Fraud         |
| 10      | Yes                 | Large        | Fraud         |

# Exact Bayes Calculations

Classify a small firm with prior legal trouble.

$$P(\text{Fraud} \mid \text{Legal Trouble} = \text{Yes}, \text{Size} = \text{Small})$$

$$= \frac{1}{2} = 0.50$$

**Calculation is limited to the two firms matching those characteristics.**

| Company | Prior Legal Trouble | Company Size | Audit Outcome |
|---------|---------------------|--------------|---------------|
| 1       | Yes                 | Small        | Truthful      |
| 2       | No                  | Small        | Truthful      |
| 3       | No                  | Large        | Truthful      |
| 4       | No                  | Large        | Truthful      |
| 5       | No                  | Small        | Truthful      |
| 6       | No                  | Small        | Truthful      |
| 7       | Yes                 | Small        | Fraud ←       |
| 8       | Yes                 | Large        | Fraud         |
| 9       | No                  | Large        | Fraud         |
| 10      | Yes                 | Large        | Fraud         |

# Naive Bayes Calculations

Classify a small firm with prior legal trouble.

$$P(\text{Fraud} \mid \text{Legal Trouble} = \text{Yes}, \text{Size} = \text{Small})$$

**Step 2:** Find the probabilities for Legal Trouble = Yes, Size = Small given Fraud.

**But first let's calculate the probability of Fraud.**

$$P(\text{Fraud}) = \frac{4}{10} = .40$$

| Company | Prior Legal Trouble | Company Size | Audit Outcome |
|---------|---------------------|--------------|---------------|
| 1       | Yes                 | Small        | Truthful      |
| 2       | No                  | Small        | Truthful      |
| 3       | No                  | Large        | Truthful      |
| 4       | No                  | Large        | Truthful      |
| 5       | No                  | Small        | Truthful      |
| 6       | No                  | Small        | Truthful      |
| 7       | Yes                 | Small        | Fraud ←       |
| 8       | Yes                 | Large        | Fraud ←       |
| 9       | No                  | Large        | Fraud ←       |
| 10      | Yes                 | Large        | Fraud ←       |

# Naive Bayes Calculations

Classify a small firm with prior legal trouble.

$$P(\text{Fraud} \mid \text{Legal Trouble} = \text{Yes}, \text{Size} = \text{Small})$$

**Step 2:** Find the probabilities for Legal Trouble = Yes, Size = Small given Fraud.

$$P(\text{Fraud}) = \frac{4}{10} = 0.40$$

$$P(\text{Legal} \mid \text{Fraud}) = \frac{3}{4} = 0.75$$

$$P(\text{Small} \mid \text{Fraud}) = \frac{1}{4} = 0.25$$

**Step 3:** Multiply them together, then by proportion of records belonging to Fraud.

$$= 0.75 * 0.25 * 0.40 = 0.075$$

| Company | Prior Legal Trouble | Company Size | Outcome  |
|---------|---------------------|--------------|----------|
| 1       | Yes                 | Small        | Truthful |
| 2       | No                  | Small        | Truthful |
| 3       | No                  | Large        | Truthful |
| 4       | No                  | Large        | Truthful |
| 5       | No                  | Small        | Truthful |
| 6       | No                  | Small        | Truthful |
| 7       | Yes ←               | Small ←      | Fraud    |
| 8       | Yes ←               | Large        | Fraud    |
| 9       | No                  | Large        | Fraud    |
| 10      | Yes ←               | Large        | Fraud    |

# Naive Bayes Calculations

Classify a small firm with prior legal trouble.

$$P(\text{Fraud} \mid \text{Legal Trouble} = \text{Yes}, \text{Size} = \text{Small})$$

**Step 4:** Repeat for Truthful.

$$P(\text{Truthful}) = 1 - 0.40 = 0.60$$

$$P(\text{Legal} \mid \text{Truthful}) = \frac{1}{6} = 0.167$$

$$P(\text{Small} \mid \text{Truthful}) = \frac{4}{6} = 0.667$$

**Repeat Step 3:** Multiply them together, then by proportion of records belonging to Truthful.

$$= 0.167 * 0.667 * 0.60 = 0.067$$

| Company | Prior Legal Trouble | Company Size | Outcome  |
|---------|---------------------|--------------|----------|
| 1       | Yes ←               | Small ←      | Truthful |
| 2       | No                  | Small ←      | Truthful |
| 3       | No                  | Large        | Truthful |
| 4       | No                  | Large        | Truthful |
| 5       | No                  | Small ←      | Truthful |
| 6       | No                  | Small ←      | Truthful |
| 7       | Yes                 | Small        | Fraud    |
| 8       | Yes                 | Large        | Fraud    |
| 9       | No                  | Large        | Fraud    |
| 10      | Yes                 | Large        | Fraud    |

# Naive Bayes Calculations

Classify a small firm with prior legal trouble.

$$P(\text{Fraud} \mid \text{Legal Trouble} = \text{Yes}, \text{Size} = \text{Small})$$

**Step 5:** Prob. of belonging to Fraud is value from Step 3 divided by sum of Fraud and Truthful.

$$= \frac{0.075}{(0.075 + 0.067)} = 0.53$$

| Company | Prior Legal Trouble | Company Size | Outcome  |
|---------|---------------------|--------------|----------|
| 1       | Yes                 | Small        | Truthful |
| 2       | No                  | Small        | Truthful |
| 3       | No                  | Large        | Truthful |
| 4       | No                  | Large        | Truthful |
| 5       | No                  | Small        | Truthful |
| 6       | No                  | Small        | Truthful |
| 7       | Yes                 | Small        | Fraud    |
| 8       | Yes                 | Large        | Fraud    |
| 9       | No                  | Large        | Fraud    |
| 10      | Yes                 | Large        | Fraud    |

# Naive Bayes Continued

- Note that probability **estimate** does not differ greatly from **exact** but may not always be the case.
- All records are used in calculations, not just those matching predictor values.
- This makes calculations practical in most circumstances.
- Relies on assumption of independence between predictor variables within each class
  - Not strictly justified since variables are often correlated with one another.
  - Often "good enough" where ranking of probabilities is more important than unbiased estimate of actual probabilities.

# One Important Consideration

What would happen with our probabilities and classification for a Small company if all companies in the training data were Large?

$$P(\textit{Small} \mid \textit{Fraud}) = \frac{0}{4} = 0.00$$

**The absence of this predictor actively "outvotes" any other information in the record when making a classification.**

| Company | Prior Legal Trouble | Company Size | Outcome  |
|---------|---------------------|--------------|----------|
| 1       | Yes                 | Small        | Truthful |
| 2       | No                  | Small        | Truthful |
| 3       | No                  | Large        | Truthful |
| 4       | No                  | Large        | Truthful |
| 5       | No                  | Small        | Truthful |
| 6       | No                  | Small        | Truthful |
| 7       | Yes                 | Large        | Fraud    |
| 8       | Yes                 | Large        | Fraud    |
| 9       | No                  | Large        | Fraud    |
| 10      | Yes                 | Large        | Fraud    |

# Smoothing Techniques

To solve for this, a method called Laplace Smoothing (additive smoothing) adds a small positive value (typically 1) to the count of each category in the feature, ensuring no probability is ever exactly zero.

$$P(x_i | y) = \frac{\text{count}(x_i, y) + a}{N + a * K}$$

Alpha is the  
smoothing  
parameter

The sklearn implementation of MultinomialNB utilizes the default additive smoothing parameter with an alpha = 1.0.

# Let's Practice: Personal Loan Example

In this example, we will work with only 2 binary variables and the target variable. The goal is to help a bank improve its conversion rate for personal loan acceptance in its next marketing campaign. We are working with training data for **3000** customers and the predictor variables are whether the customer currently has a Credit Card and Online Banking.

Here is a summary of the data:

| Credit Card (CC) | Online (OL) | Personal Loan (Loan) |     |
|------------------|-------------|----------------------|-----|
|                  |             | 0                    | 1   |
| 0                | 0           | 792                  | 73  |
|                  | 1           | 1117                 | 126 |
| 1                | 0           | 327                  | 39  |
|                  | 1           | 477                  | 49  |

# Let's Practice: Personal Loan Example

Calculate the exact probability.

| Credit Card (CC) | Online (OL) | Personal Loan (Loan) |     |
|------------------|-------------|----------------------|-----|
|                  |             | 0                    | 1   |
| 0                | 0           | 792                  | 73  |
|                  | 1           | 1117                 | 126 |
| 1                | 0           | 327                  | 39  |
|                  | 1           | 477                  | 49  |

$$P(\text{Loan} = 1 \mid \text{CC} = 1, \text{OL} = 1)$$

$$= \frac{49}{(49 + 477)}$$

$$= 0.093$$

# Let's Practice: Personal Loan Example

Calculate the Naïve Bayes probability.

| Credit Card<br>(CC) | Personal Loan<br>(Loan) |     |
|---------------------|-------------------------|-----|
|                     | 0                       | 1   |
| 0                   | 1909                    | 199 |
| 1                   | 804                     | 88  |

| Online (OL) | Personal Loan<br>(Loan) |     |
|-------------|-------------------------|-----|
|             | 0                       | 1   |
| 0           | 1119                    | 112 |
| 1           | 1594                    | 175 |

$$P(\text{Loan} = 1) = \frac{287}{3000} = 0.095667 \quad = 0.0957 * 0.307 * 0.61$$

$$P(\text{CC} \mid \text{Loan} = 1) = \frac{88}{(199+88)} = 0.30662 \quad = 0.0179$$

$$P(\text{OL} \mid \text{Loan} = 1) = \frac{175}{(112+175)} = 0.609756$$

# Let's Practice: Personal Loan Example

Calculate the Naïve Bayes probability.

| Credit Card (CC) | Personal Loan (Loan) |     |
|------------------|----------------------|-----|
|                  | 0                    | 1   |
| 0                | 1909                 | 199 |
| 1                | 804                  | 88  |

| Online (OL) | Personal Loan (Loan) |     |
|-------------|----------------------|-----|
|             | 0                    | 1   |
| 0           | 1119                 | 112 |
| 1           | 1594                 | 175 |

$$P(\text{Loan} = 0) = \frac{2713}{3000} = 0.904333 \quad = 0.904 * 0.296 * 0.588$$

$$P(\text{CC} \mid \text{Loan} = 0) = \frac{804}{(1909+804)} = 0.296351 \quad = 0.157$$

$$P(\text{OL} \mid \text{Loan} = 0) = \frac{1594}{(1119+1594)} = 0.587541$$

$$P(\text{Loan} = 1 \mid \text{CC} = 1, \text{OL} = 1) = \frac{0.0179}{(0.0179+0.157)} = 0.102$$

# Advantages and Shortcomings

## Advantages

- Handles purely categorical data well.
- Works well with very large data sets.
- Simple and computationally efficient.

## Shortcomings

- Requires a large training dataset.
- Requires smoothing techniques to handle when important rare events are not present in the training data.
